The Deal- 2006

The Cable and Telecommunications Professionals' Reference-Goff Hill 2008 Volume 2 of TERB 3ed covers the convergence of telephony and data transport, including wireless networks. Now that data is becoming the predominant source of traffic more efficient multiplexing schemes and more flexible control methods are needed in the transport network, such as giving the customer the ability to call for bandwidth on demand. With the development of control methods for switched data services it is now recognised that improved ways to control the transport network are possible and standards initiatives are taking place to establish and improve the network control layer. Detailed explanation of propagation in wireless and

optical fibre systems requires a substantial amount of mathematics, also covered in this volume. For each of the math chapters there is an explanation of why the mathematics is important, where it is applied and references to other chapters. * AUTHORITATIVE: All contributors are recognized experts in their field and come from leading institutions. * INTERNATIONAL: In this age of globalization and standardization, special attention has been paid--both topically and authorially--to ensure the broad applicability and relevance of this material. * EXHAUSTIVE: A thorough reference describing the convergence of telephony and data transport, including wireless networks.
