Sewing Success?-Gladys Lopez-Acevedo 2012-03-14 The end of the MFA was followed by rising apparel exports, falling prices, and a reallocation of production and employment between countries. There were also significant changes within countries. The first main finding of this report is that export and employment patterns after the MFA/ATC did not necessarily match predictions. While many predicted that production would shift to low-wage countries, this book shows that only 13 percent of variation in export changes post-MFA can be explained by the differences in wage levels. Second, changes in exports are usually, but not always, good indicators of what happens to wages and employment within countries. This is especially important for policy because it shows that simply using exports as a metric of 'success' in terms of helping the poor is not sufficient. Third, the Book identifies the specific ways that changes in the global apparel market affected earnings. The Book shows that wage premiums change in predictable ways: rising (in most cases) in countries that were proactive in adapting to the MFA phase-out and expanded their market shares, and falling in countries that failed to respond in a timely fashion to the changing environment. The Book shows that promoting 'upgrading' (defined as shifting to higher-value goods, shifting up the value chain, or 'modernizing' production techniques) seems to be necessary for sustainable competitiveness in the apparel sector but does not necessarily help the poor. Policies that support upgrading need to be complemented with targeted workforce development to make sure that the most vulnerable workers are not left behind. Having a vision for the evolution of the apparel sector that incorporates developing worker skills seems crucial. Otherwise, less-skilled workers could miss out on opportunities to gain valuable work experience in manufacturing.

Surface Generation in Ultra-precision Diamond Turning-W. B. Lee 2003-02-07 An 'Engineering Research Series' title. One of the remarkable achievements of modern manufacturing techniques is the ability to achieve nano-metre surface finishes. Ultraprecision machining based on single-point diamond turning (SPDT) is a very important technique in the manufacture of high-precision components where surface finish is critical. Complex optical surfaces, for example, can be produced without the need for post-machining polishing. This book focuses on the aspect of modelling nano-surface generation in ultra precision SPDT. Potential industrial applications in the prediction of surface quality, the process optimization, and precision mould manufacturing are also studied. The essential differences between single-point diamond turning and conventional machining are described. The history and technology of single-point diamond turning are presented and single chapters emphasize the related metrology and cutting mechanics. Important aspects of surface generation are also discussed. Features of the text are the sound approach, systematic mathematical modelling, and computer-aided simulation of surface generation in the development of surfaces exhibiting nano-surface qualities. TOPICS COVERED INCLUDE: Fundamentals of ultra-precision diamond turning technology Cutting mechanics and analysis of microcutting force variation Mechanisms of surface generation Characterization and modelling of nano-surface generation Computer-aided simulation of nano-surface generation Diamond turning of aspheric optics. Based upon the extensive experience of the authors Surface Generation in Ultra-precision Diamond Turning: Modelling and Practices will be of interest to engineers, scientists, and postgraduate students.
