Monte Carlo Methods and Models in Finance and Insurance-Ralf Korn 2010-02-26 Offering a unique balance between applications and calculations, Monte Carlo Methods and Models in Finance and Insurance incorporates the application background of finance and insurance with the theory and applications of Monte Carlo methods. It presents recent methods and algorithms, including the multilevel Monte Carlo method, the statistical Romberg method, and the Heath-Platen estimator, as well as recent financial and actuarial models, such as the Cheyette and dynamic mortality models. The authors separately discuss Monte Carlo techniques, stochastic process basics, and the theoretical background and intuition behind financial and actuarial mathematics, before bringing the topics together to apply the Monte Carlo methods to areas of finance and insurance. This allows for the easy identification of standard Monte Carlo tools and for a detailed focus on the main principles of financial and insurance mathematics. The book describes high-level Monte Carlo methods for standard simulation and the simulation of stochastic processes with continuous and discontinuous paths. It also covers a wide selection of popular

models in finance and insurance, from Black-Scholes to stochastic volatility to interest rate to dynamic mortality. Through its many numerical and graphical illustrations and simple, insightful examples, this book provides a deep understanding of the scope of Monte Carlo methods and their use in various financial situations. The intuitive presentation encourages readers to implement and further develop the simulation methods.

**The Valuation of Financial Companies-Mario Massari 2014-01-07** This book presents the main valuation approaches that can be used to value financial institutions. By sketching 1) the different business models of banks (both commercial and investment banks) and insurance companies (life, property and casualty and reinsurance); 2) the structure and peculiarities of financial institutions' reporting and financial statements; and 3) the main features of regulatory capital frameworks for banking and insurance (ie Basel III, Solvency II), the book addresses why such elements make the valuation of financial institutions different from the valuation of non-financial companies. The book then features the valuation models that can be used to determine the value of banks and insurance companies including the Discounted Cash Flow, Dividend Discount Model, and Residual Income Model (with the appropriate estimation techniques for the cost of capital and cash flow in financial industries). The main techniques to perform the relative valuation of financial institutions are then presented: along the traditional multiples (P/E, P/BV, P/TBV, P/NAV), the multiples based on industry-specific value drivers are discussed (for example, P/Pre Provision Profit, P/Deposits, P/Premiums, P/Number of branches). Further valuation tools such as the "Value Maps" or the "Warranted Equity Method" will be explained and discussed. The closing section of the book will briefly focus on the valuation of specific financial companies/vehicles such as closed-end funds, private equity funds, leasing companies, etc.

Pozner 2012-09-27 In Cross-Examination: Science and Techniques, Second Edition, Larry Pozner and Roger Dodd continue their outstanding tradition of helping attorneys conduct commanding cross-examinations. The second edition offers deeper analysis of cross-examination methods, with more integration and interrelationship of techniques and principles. In analyzing thousands of new trial experiences, they present efficient techniques to confront the challenges of evolving admissibility standards and electronic discovery, and ultimately, help attorneys develop cross-examination skills that are critical to trial success. Inside you'll find valuable advice on how to:

- Use opponents' objections as the springboard for deeper and broader cross-examinations.
- Sequence cross-examination to teach the theory of the case in the best way, and to literally expand the rules of admissibility.
- Use "loops" (the practice of incorporating and repeating key phrases and terms in successive questions to the witness) to rename witnesses and exhibits.
- Use "double loops" to discredit opposing expert witnesses.
- Use voir dire to create great jurors
- Use a fact-driven investigation to develop a winning theory
- Use a witness's own words to follow your theme and theory
- Control the runaway witness
- Communicate winning theories in opening, cross, and closing
- Use loops to box in the witness
- Use tactical sequencing to create the most powerful cross
- Convert a witness's silence into admission of fact
- Induce the witness to voice your pre-selected words
- Prepare for devastating impeachment
- Close off any escape routes for the witness
- Punish the evasive or "I don't know" witness
- Control the crying witness
- Use timing, posture, inflection, diction, wording, eye contact, and other effects to emphasize a witness's concession

Effective cross-examination is a science with established guidelines, identifiable techniques, and definable methods. Attorneys can learn how to control the outcome with careful preparation, calculated strategy, effective skills, and a disciplined demeanor. Quantitative Risk Management: Concepts, Techniques, and Tools-Alexander J. McNeil 2005-10-16 The implementation of sound quantitative risk models is a vital concern for all financial institutions, and this trend has accelerated in recent years with regulatory processes such as Basel II. This book provides a comprehensive treatment of the theoretical concepts and modelling techniques of quantitative risk management and equips readers--whether financial risk analysts, actuaries, regulators, or students of quantitative finance--with practical tools to solve real-world problems. The authors cover methods for market, credit, and operational risk modelling; place standard industry approaches on a more formal footing; and describe recent developments that go beyond, and address main deficiencies of, current practice. The book's methodology draws on diverse quantitative disciplines, from mathematical finance through statistics and econometrics to actuarial mathematics. Main concepts discussed include loss distributions, risk measures, and risk aggregation and allocation principles. A main theme is the need to satisfactorily address extreme outcomes and the dependence of key risk drivers. The techniques required derive from multivariate statistical analysis, financial time series modelling, copulas, and extreme value theory. A more technical chapter addresses credit derivatives. Based on courses taught to masters students and professionals, this book is a unique and fundamental reference that is set to become a standard in the field.
