Voice Disorders Secondary to Thyroidectomy-Samantha D'Agostino 2019 The thyroid is an important gland that aids in development. Located anteriorly at the base of the neck, the thyroid produces hormones that regulate metabolism. Thyroid dysfunction can lead to excess or reduced production of hormones known as hyper and hypothyroidism. Usually affecting women, hyper and hypothyroidism can be life-threatening. A well-known treatment is a thyroidectomy, or removal of the thyroid gland. Many people report vocal change secondary to thyroidectomy. Dysfunction can result from intubation during surgery or damage to laryngeal nerves and/or muscles. A participant's low intensity and difficulty with projection prompted a case-study to examine the laryngeal area for differences.

KayPENTAX Visi-Pitch and Videostrobe instrumentation were utilized to provide instant video feedback and acoustic parameters that were compared to typical parameters/structures. Using videostroboscopy, a rigid scope was placed over the base of the tongue containing a miniature camera. The participant phonated syllables such as "ee" and "ah" from low to high pitch ranges at Cleveland State University (CSU). A voice sample was also analyzed through Visi-Pitch instrumentation to assess parameters including jitter, shimmer, and fundamental frequency among others. Structural and acoustic parameters from Cleveland State were compared to results from an Ear, Nose, and Throat (ENT) doctor also utilizing videostroboscopy. Both CSU and ENT results note structural and acoustic differences despite no reported laryngeal nerve damage post-thyroidectomy.

100 Cases in Clinical Medicine, Second Edition-John Rees 2011-12-09 100 Cases in Clinical Medicine is an indispensable revision tool for medical students preparing for clinical examinations or OSCEs. Using scenarios which mimic daily life, the cases will interest students in clinical problems and help them develop their clinical reasoning skills, with each case presenting details of a patient's medical history and the key findings of a clinical examination, together with initial investigation results for evaluation. Key questions then prompt the student to evaluate the patient, and reach a decision regarding their condition and the possible management plan, while the answer pages will help the student to understand the processes that a clinician goes through in dealing with the problems presented. Contents are organised to provide a quick review of each body system, with a selection of cases relevant to that specific system, then the majority are presented randomly to mimic real life in a GP surgery or emergency department. New to this edition: a review of each body system as well as random cases; new page design with a second colour used throughout; and brought up-to-date with 25% new cases.
